Definition of Minimum Edit Distance

How similar are two strings?

Spell correction

- The user typed "graffe"Which is closest?
 - graf
 - graft
 - grail
 - giraffe

- Computational Biology
 - Align two sequences of nucleotides

```
AGGCTATCACCTGACCTCCAGGCCGATGCCC
TAGCTATCACGACCGCGGTCGATTTGCCCGAC
```

• Resulting alignment:

```
-AGGCTATCACCTGACCTCCAGGCCGA--TGCCC---
TAG-CTATCAC--GACCGC--GGTCGATTTGCCCGAC
```

Also for Machine Translation, Information Extraction, Speech Recognition

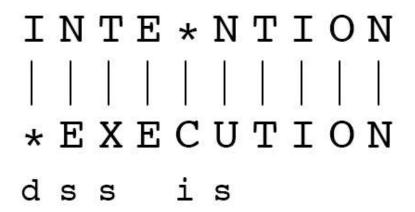

Edit Distance

The minimum edit distance between two strings Is the minimum number of editing operations

- Insertion
- Deletion
- Substitution

Needed to transform one into the other

Two strings and their alignment:

If each operation has cost of 1

Distance between these is 5

If substitutions cost 2 (Levenshtein)

Distance between them is 8

Alignment in Computational Biology

Given a sequence of bases

AGGCTATCACCTGACCTCCAGGCCGATGCCC
TAGCTATCACGACCGCGGTCGATTTGCCCGAC

An alignment:

```
-AGGCTATCACCTGACCTCCAGGCCGA--TGCCC---
TAG-CTATCAC--GACCGC--GGTCGATTTGCCCGAC
```

Given two sequences, align each letter to a letter or gap

Other uses of Edit Distance in NLP

Evaluating Machine Translation and speech recognition

How to find the Min Edit Distance?

Searching for a path (sequence of edits) from the start string to the final string:

- Initial state: the word we're transforming
- Operators: insert, delete, substitute
- Goal state: the word we're trying to get to
- Path cost: what we want to minimize: the number of edits

Minimum Edit as Search

But the space of all edit sequences is huge!

- We can't afford to navigate naïvely
- Lots of distinct paths wind up at the same state.
 - We don't have to keep track of all of them
 - Just the shortest path to each of those revisted states.

Defining Min Edit Distance

For two strings

- X of length n
- Y of length *m*

We define D(i,j)

- the edit distance between X[1..i] and Y[1..j]
 - i.e., the first *i* characters of X and the first *j* characters of Y
- The edit distance between X and Y is thus D(n,m)

Definition of Minimum Edit Distance

Computing Minimum Edit Distance

Dynamic Programming for Minimum Edit Distance

Dynamic programming: A tabular computation of D(n,m) Solving problems by combining solutions to subproblems. Bottom-up

- We compute D(i,j) for small i,j
- And compute larger D(i,j) based on previously computed smaller values
- i.e., compute D(i,j) for all i (0 < i < n) and j (0 < j < m)

Defining Min Edit Distance (Levenshtein)

Initialization

$$D(i,0) = i$$

 $D(0,j) = j$

Recurrence Relation:

For each
$$i = 1...M$$

For each $j = 1...N$

$$D(i,j) = \min \begin{cases} D(i-1,j) + 1 \\ D(i,j-1) + 1 \\ D(i-1,j-1) + 2; \begin{cases} if X(i) \neq Y(j) \\ if X(i) = Y(j) \end{cases}$$
mination:

Termination:

D(N,M) is distance

Computing Minimum Edit Distance

Backtrace for Computing Alignments

Computing alignments

Edit distance isn't sufficient

 We often need to align each character of the two strings to each other

We do this by keeping a "backtrace"

Every time we enter a cell, remember where we came from

When we reach the end,

 Trace back the path from the upper right corner to read off the alignment

Adding Backtrace to Minimum Edit Distance

Base conditions:

$$D(i,0) = i$$

$$D(0,j) = j$$

Termination:

D(i,0) = i D(0,j) = j D(N,M) is distance

Recurrence Relation:

For each
$$i = 1...M$$

For each $j = 1...N$

$$D(i-1,j) + 1$$

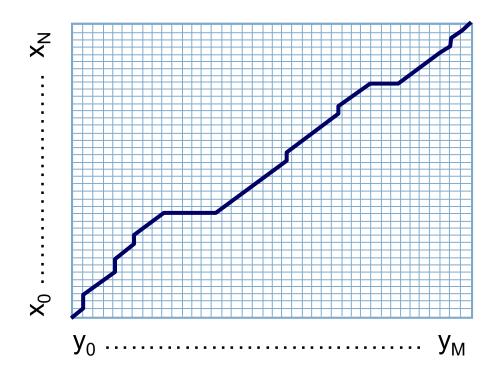

$$D(i,j-1) + 1$$

$$D(i-1,j-1) + 2; \text{ if } X(i) \neq Y(j) \text{ substitution}$$

$$0; \text{ if } X(i) = Y(j)$$

$$\text{ptr}(i,j) = \begin{cases} \text{DOWN} & \text{deletion} \\ \text{DOWN} & \text{deletion} \\ \text{DIAG} & \text{substitution} \end{cases}$$

The Distance Matrix

Every non-decreasing path

from (0,0) to (M, N)

corresponds to an alignment of the two sequences

An optimal alignment is composed of optimal subalignments

SLIDE ADAPTED FROM SERAFIM BATZOGLOU WITH PERMISSION

O(n+m)

Backtrace for Computing Alignments

Weighted Minimum Edit Distance

Weighted Edit Distance

Why would we add weights to the computation?

- Spell Correction: some letters are more likely to be mistyped than others
- Biology: certain kinds of deletions or insertions are more likely than others
